Art Unit: 2444

DETAILED ACTION

1. This action is in response to communications filed on 11/30/2009. Claim(s) 3 has been canceled. No other claims have been amended, added, or canceled. Accordingly, claim(s) 1-2, 4-10 are pending.

Response to Arguments

- 2. Applicant's arguments filed 11/30/2009 have been fully considered but they are not persuasive. In substance the applicant argues that **Fuimori** nor **Nakai**, alone or in combination, discloses or suggests that an interim response is first transmitted reflecting the received command will be executed when a current time based on the synchronized clock reaches a time represented by the time-stamp included in the command.
- 3. In response to applicant's argument, the examiner respectfully disagrees.

 Applicant claims broadly and as such the examiner will interpret the claims broadly.

 The examiner asserts, that **Fujimori** discloses in one embodiment of his invention, a data transfer system comprising a plurality of nodes each having an internal oscillating circuit to generate a clock signal. As such, within this embodiment, there is a first signal (i.e. an interim response) which is generated, by a transmitting node, in response to a train of data received with time data (i.e. a synchronization signal/command supplied by another node) by which synchronous communication can be ensured. Furthermore, a receiving node generates a second signal which causes a synchronizing device to reset the counting device to adjust all bits of the count data in synchronizing with the time data. The examiner would like to point out that the applicant already admits the teaching of a "complete response" on page 10 of the Remarks section: "the response

Art Unit: 2444

node in Nakai transmits only one response, which at most corresponds to 'the complete response' as recited in claims 1, 2, and 7-10." Therefore, the examiner asserts that the combination of **Fujimori** and **Nakai** still meet the limitations of the instant claims.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 1-2 and 4-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fujimori et al. (hereinafter Fujimori) U.S. Patent No.: 6,148,051 and further in view of Nakai et al. (hereinafter Nakai) U.S. Publication No.: 2002/0064185 A1.
- 6. Regarding Claim 1(and 2, 8 & 10) Fujimori discloses: A command synchronization establishment system comprising:

a network wherein a cycle master node managing time on the network periodically transmits a cycle start packet including time information to each node connected to the network, each node synchronizes its clock in accordance with the time information included in the cycle start packet so as to assure isochronism on the network by sharing the synchronized clock with each other node (Fujimori: Figures 1- 6 and Col. 6 lines 13- 21; master node, cycle time extracting circuit, cycle start packet and cycle packet train. Nakai: Figures 2 and 6 and par. 1; cycle master, cycle start, synchronizing among nodes and time stamps), data is transferred by an isochronous transfer, and a

Art Unit: 2444

command is transferred by an asynchronous transfer using a time period after the isochronous transfer until the next cycle start packet;

Page 4

a controller as a node connected to the network, comprising a transmitter that transmits a command including a time-stamp based on the synchronized clock to a target apparatus by using the asynchronous transfer; and

the target apparatus as another node connected to the network, comprising a receiver that receives the command, a storage device that temporally stores the received command in order not to execute the received command instantly, a transmitter that transmits an interim response to the controller reflecting that the received command will be executed when a current time based on the synchronized clock reaches a time represented by the timestamp included in the command, an executing device that executes the received command when the current time based on the synchronized clock reaches the time represented by the time-stamp included in the command, and a replying device that provides a complete response indicating completion of executing the command.

However, **Fujimori** remains silent on the specific teachings of data is transferred by an isochronous transfer, and a command is transferred by an asynchronous transfer using a time period after the isochronous transfer until the next cycle start packet;

Art Unit: 2444

a controller as a node connected to the network, comprising a transmitter that transmits a command including a time-stamp based on the synchronized clock to a target apparatus by using the asynchronous transfer; and

Page 5

the target apparatus as another node connected to the network, comprising a receiver that receives the command, a storage device that temporally stores the received command in order not to execute the received command instantly, a transmitter that transmits an interim response to the controller reflecting that the received command will be executed when a current time based on the synchronized clock reaches a time represented by the time-stamp included in the command, an executing device that executes the received command when the current time based on the synchronized clock reaches the time represented by the time-stamp included in the command, and a replying device that provides a complete response indicating completion of executing the command.

In the same field of endeavor, **Nakai** discloses an data is transferred by an isochronous transfer, and a command is transferred by an asynchronous transfer using a time period after the isochronous transfer until the next cycle start packet (**Nakai**: Figures 18 and par. 13, 24 and 152; command content and asynchronous band);

a controller as a node connected to the network, comprising a transmitter that transmits a command including a time-stamp based on the synchronized clock to a target apparatus by using the asynchronous transfer (Figures 2, 5 and

Art Unit: 2444

18 and par. 13, 24 and 152; command content, time stamps and asynchronous transmission); and

Page 6

the target apparatus as another node connected to the network, comprising a receiver that receives the command, a storage device that temporally stores the received command in order not to execute the received command instantly, a transmitter that transmits an interim response to the controller reflecting that the received command will be executed when a current time based on the synchronized clock reaches a time represented by the timestamp included in the command, an executing device that executes the received command when the current time based on the synchronized clock reaches the time represented by the time-stamp included in the command (Figures 18 & 24 and par. 152; request/response nodes, reaching the received time and time stamps), and a replying device that provides a complete response indicating completion of executing the command (Figures 18 & 24 and par. 152- 153; request/response nodes and acknowledgement packets).

Accordingly it would have been obvious for one of ordinary skill in the networking art to modify or incorporate **Nakai's** teachings of waiting until the time stamp time before executing an action with the teachings of **Fujimori**, to provide for a more efficiency in synchronizing systems.

7. Regarding **claim 4 Fujimori-Nakai** further discloses:

wherein said each node connected to the network shares the synchronized clock with each other node by copying the time information

Art Unit: 2444

included in the cycle start packet to a cycle time register in each node, and said time-stamp included in the command is in a format including a part or all formats of the cycle time register (Figures 1-5B and Abstract & Col. 4 lines 8-26; time stamp register, cycle timing register, cycle period, clock generating circuit and delay and comparing circuit and synchronizing internal time data).

Page 7

8. Regarding **claim 5 Fujimori-Nakai** further discloses:

wherein said command includes a flag instructing the executing device to execute the command instantly or when the current time reaches the time represented by the time-stamp included in the command, and the target apparatus determines whether to execute the received command instantly or when the current time reaches the time represented by the time-stamp in accordance with the flag (Nakai: Figures 18- 25 and Par. 152; time stamps, acknowledgement packets and waiting until time stamp time and starting action).

9. Regarding **claim 6 Fujimori-Nakai** further discloses:

wherein the flag uses a part of a format of the time-stamp included in the command (Figures 1-5B and Abstract & Col. 4 lines 8-26; time stamp register, receipt register, time register, cycle timing, cycle period, clock generating circuit and delay and comparing circuit and data packets and synchronizing internal time data).

Art Unit: 2444

10. Claim 7 is substantially the same as claims 1-2, 4-6, 8 and 10, but in method form rather than system form, and is therefore rejected using the same rationale as in claims 1-2, 4-6, 8 and 10.

11. Claim 9 is substantially the same as claims 1-2, 4-6, 8 and 10, but in apparatus form rather than system form, and is therefore rejected using the same rationale as in claims 1-2, 4-6, 8 and 10.

Examiner Note: Examiner has cited particular columns and line numbers in the references as applied to the claims above for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to the specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in its entirety as potentially teaching of all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the examiner.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MACEEH ANWARI whose telephone number is (571)272-7591. The examiner can normally be reached on Monday-Friday 7:30-5:00 PM ES.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Vaughn can be reached on 571-272-3922. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
